1 Introduction

Sit back, relax, and play--- SABA's games!

Massively multiplayer online role-playing games (MMORPGs) are emerging in the computer game industry as a very popular genre. These games have existed since the late 1990s, but in the last few years the market has become increasingly strong. This relatively new genre is attracting a widespread audience, bringing together those who previously enjoyed both pen and paper and computer role-playing games, as well as those who enjoy socializing with other players in a virtual environment.

The MMORPG gaming market is expected to grow at about 9.5% during the forecast period of 2020-2025. The increasing trend for online gaming among players has led to the creation of a virtual world for video gamers, where they get a virtual economy, currency, trade environment, and real-time scenarios to deal with. With the help of advanced gaming technology, the game developers successfully keep the gamers engaged in the role-playing games and encourage them to stake more real money to receive the benefits or "boosters" over the games.

1.1 Background

SABA Inc. is a game production and distribution studio specializing in MMORPGs where you can explore our latest releases in our stores or online on google stadia. It is established in 2020 with the aim to be players favorite game producer by making high-quality online role-playing games to reach five million subscribers by the end of 2021.

Our product offerings are Fruit Saga which is our MMORPG and a list of in-game equipment. The equipment list contains navigation tools like maps and compass, cutting tools (knives and bow saw), building equipment and weapons for conquering other kingdoms. Moreover, a player will actively participate in the creativity and design of new personalized in-game equipment with the SABA to tailor his needs in a more personalized manner. Furthermore, SABA has an agreement with a number of ISPs to reach our players through their subscription to the ISPs.

1.2 Fruit Saga

In the fruit saga a player will be engaged to accomplish quests and missions.

Quests are like ordinary jobs--the player performs a task to acquire rewards and/or in-game money to support his in-game equipment buying.

Missions, however, advance the storyline and the progress of the player character, gaining the player new privileges such as access to new areas in the kingdom or an increase in rank or tools/weapons stock. The kingdom is full of surprises and meant to mimic different landscapes. Avoiding dangers, making friends, getting help to conquer other kingdoms and make empires is all part of the excitement in the game. Losing track in the kingdom or the failure to collect the right fruit within a time frame would lead to loss of life and eventually termination of the game.

2 Value Network Analysis

A player will buy Fruit Saga directly from our studio, from our retailers in CDs or online from google stadia. These two agents with SABA make delivery of the game to the player possible. Moreover, the player makes a purchase of in-game equipment from SABA Inc. or other authorized third-party suppliers or even from other players.

The resources which the company has control over are cash, game inventory, subscription pool and in-game equipment. Whenever there is a sale or free subscription giveaways according to prior agreement to the ISPs, the inventory will be updated accordingly. Moreover, the game forum will provide the company with innovative design ideas to be included in the games which will be accounted for as an internal resource to SABA Inc. later on.

Therefore, we can say that the main economic events from the perspective of SABA Inc. are handling sales orders from the customers and making purchases. These purchases are to be made in order to get access to innovative design ideas from the game forum and advertisements from the ad provider through sponsorship and payments respectively. Therefore the wholistic list in REA ontology can be summarized as follows:-

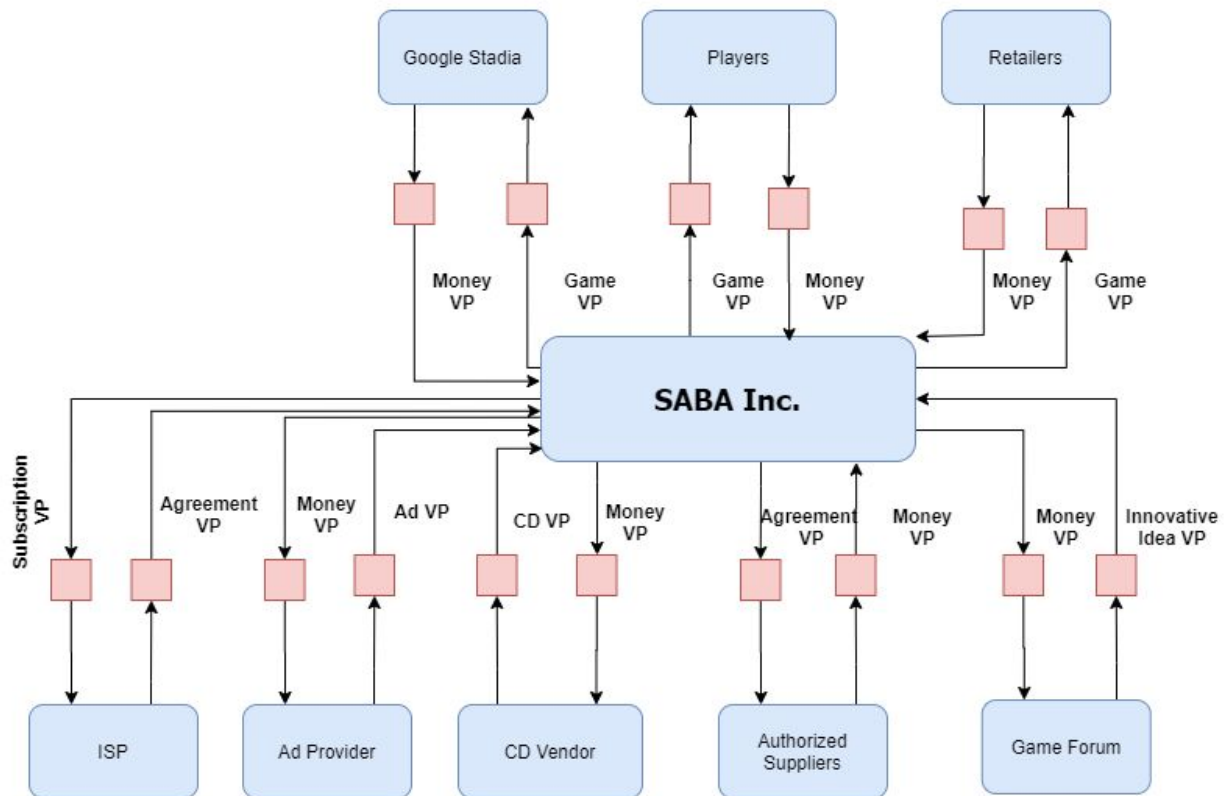

Economic resources : CDInventory,Cash, Innovative ideas, In-Game Equipment,advertisement and Agreement.

Economic Events : Sales order, Cash-payment, purchase order and delivery

Economic Agents : SABA Inc.,Google stadia, players, ISP's, Authorized suppliers, retailers, GameForum, Ad provider and CD vendor.

2.1 VDML Diagram

SABBA's Value Delivery Modeling Language (VDML)

2.2 VDML Diagram Explained

One aspect of VDML diagrams is to represent a collaboration among economically independent business entities like the customers, the game forum and the suppliers as in our case. This network may represent customer relationships and relationships with suppliers or other business partners. The VDML Figure above represents such exchanges at different levels of abstraction. In a viable business network, participants exchange values such that each participant receives values(VP) that, in its context, has greater economic value than the values(VP) it provides. The above VDML diagram depicts the value proposition SABA Inc. offers in exchanges with another VP from a number of economic agents. A player for example exchanges money VP with the game VP.

There are in total 9 agents including Sabba the VDML diagram listed as follows:-

- SABBA Games is the start up company with the aim of delivering MMORPG games.
- Players are the main customers which the game is produced for and pay to play it.
- Retailers are those companies which will buy the game in larger quantities then sell it to players
- ISPs are Internet Service Providers who will give access to their customers subscriptions so that they can play the game in accordance with prior agreement with Sabba.
- Third Party Suppliers supply players with in-game equipment then pay a fee from every transaction to Sabba.
- Game Forum is a group of enthusiasts who will promote the games on their websites where good players exchange game ideas to help further development through sponsorship.
- CD vendors sell the company with blank CDs to be used in the production of the end CD which has the game loaded on it.
- Google Stadia is a platform that sells the game on behalf of the company with the aim of getting the piece of the pie in every transaction.
- Ad Providers are those companies who will make the production of advertisement for the game to be promoted in medias like youtube or TV. They will be paid for their services.

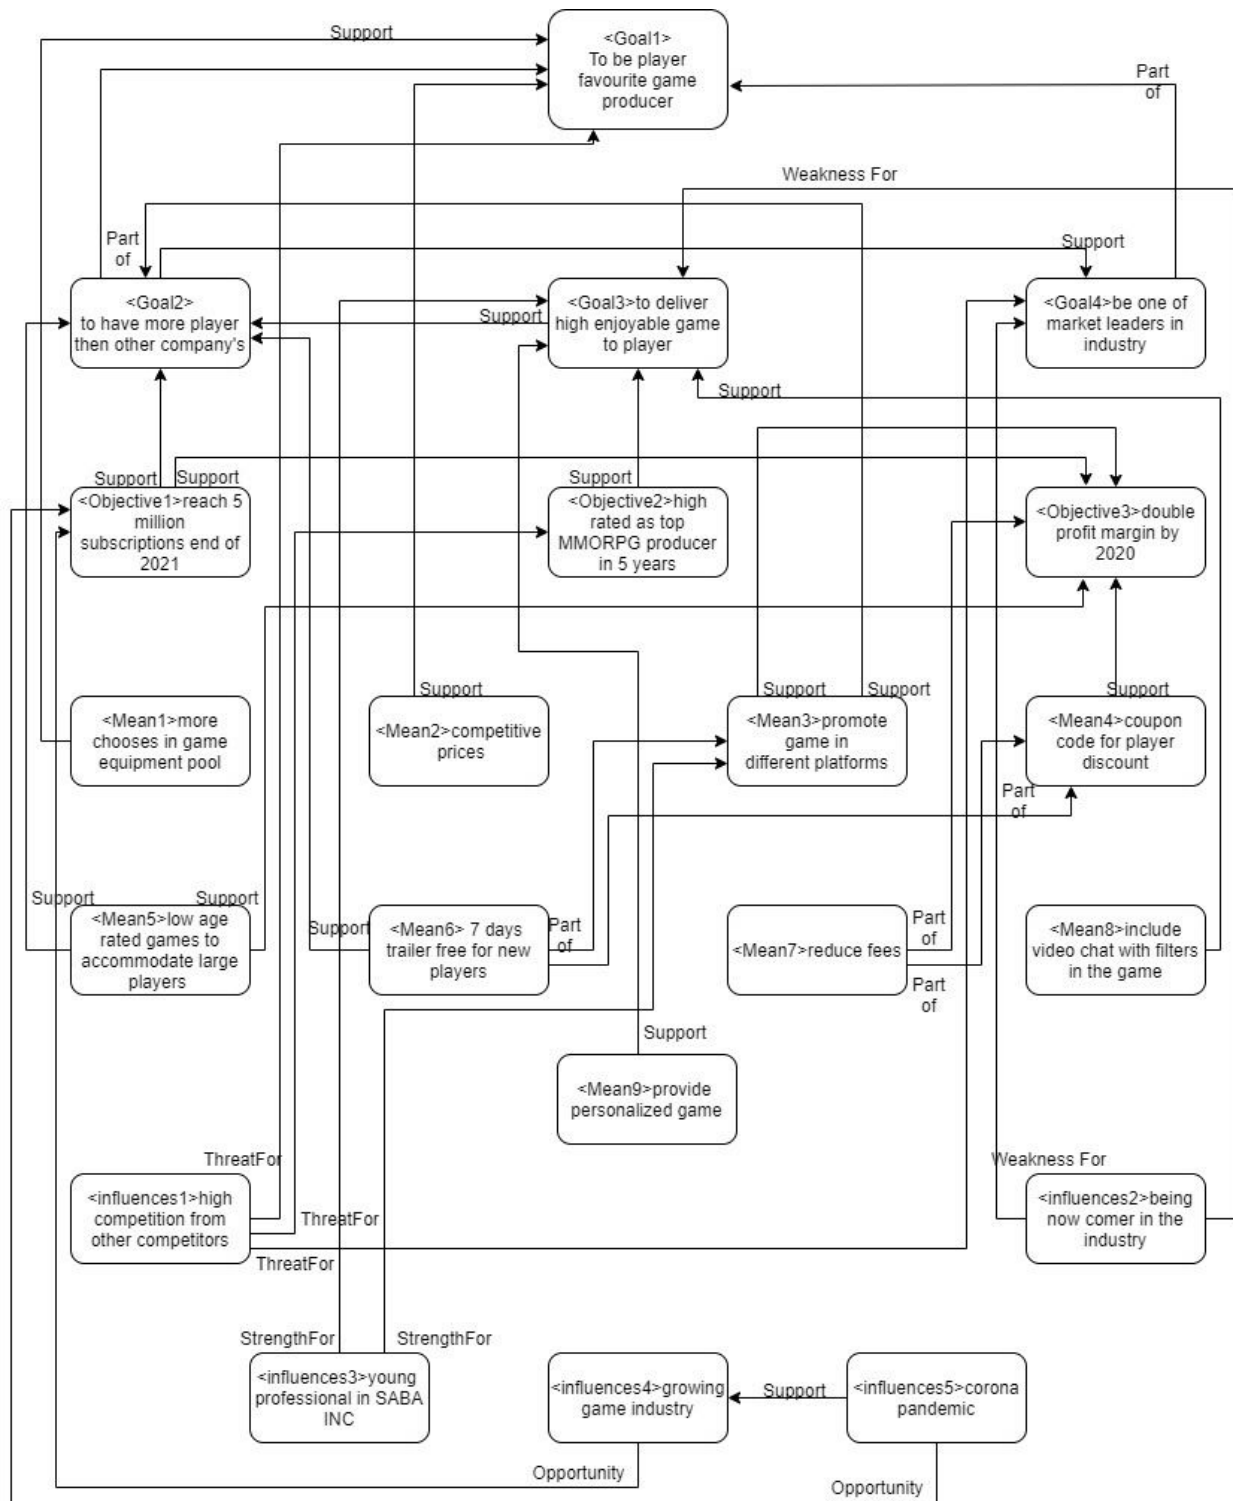

3 Goal Design

In this era of IT there are many game companies already in the market and also new game companies launch games almost everyday. Customers always think about their facilities and

loyalty. New games are a risky project and could be a failure. SABA games always think about customer satisfaction because we do market surveys to provide best content and features. Our first priority is gaining customer loyalty and satisfaction. That can help SABA games to achieve their goals and objectives.

We always try to engage our customers with new features and latest user experiences. Players are always looking for new features to explore and we have some innovative and experienced team members who are always updating and adding features.

3.1 Goal Model

3.2 Goal Model Explained

Include a textual description of the BMM model that explains it and shows how it is related to the components of the five forces model.

The vision of SABA Inc. is to be players favorite game producing company. The sub goals supporting this mission are delivering highly enjoyable games, have more players than other competitors and ultimately be one of the market leaders in the industry.

The main objectives SABA Inc. would like to achieve in a measured time frames are

- Reaching 5 million subscribers by the end of 2021
- Doubling profit margin by the end of the year
- To be highly rated as top MMORPG producer within the next five years

Goal Model's relationship with the components of the five forces model

1. Competitive Rivalry

Rivalry is high when there are a lot of competitors with a roughly equal size and power within the existing competitors. Moreover rivalry is high when there are high barriers to exit. Since SABA is new, it faces a threat of new entrants in terms of rivalry between existing competitors being high in the gaming industry. Other companies that have been in the market for a longer period of time don't make this competition easier. SABA acknowledge such a threat and want to break through introducing innovative cost cutting business models to successfully enter the industry and shake the existing companies in the industry.

The main goal of any company is to stay in this market and gain financial benefits that help the company grow and make it one of the companies that are highly effective in this field - at the same time other companies have goals that are similar to ours, and also seeking to control the market

Comments: as a company that has new and innovative ideas that help attract Users and focus on what can make the game more interactive is the main thing that will help our company to stay in the market - as well as interest in financing is essential to keep the company working.

2. Threat of New Entrants

New entries in the industry will bring a new capacity and the design to gain the market share. Which in turn will put a pressure on prices, costs, and the rate investments that are necessary to

compete. The seriousness of the threat is determined by the entry barriers. The higher the barriers the lower the entry and vice versa. E.g. of barriers of the entries are; the need of economic scale, high customer loyalty for existing brands, large capital requirements, the need for cumulative experience, government policies and limited access to distribution channels. Usually existing competitors lower their product price in order to scare the new competitors. And if new competitors enter the industry, existing companies might need to increase their investment in product development or marketing in order to maintain their place. Both will increase cost and lower the profit margin for existing competitors.

The overview of a market that contains game products and utilities is to provide and find everything that is new and interesting to the customer and satisfies his ideas and requirements - but at the same time this market and in this view represents a great challenge for new companies that try to prove themselves in this field and seek to acquire new players who will help the survival of the company. In this market through the company's financial flow

Comments: Focusing on players and product users and trying to gain trust and loyalty is an essential thing for our company

3. Threat of Substitute Products

A substitute product performs the same or similar products through different means in the industry. They tend to fulfil the same underlying need even though they don't appear to be identical on the surface. Therefore it's quite easy to be overlooked, and increases the chance that customers will switch to the alternatives. The factors that determine the total threat of substitute products are; the number of substitutes, the relative price-performance (trade-off) and the willingness of players to substitute. This can be mitigated by lowering the price, spending more money on advertisement or investing heavily in product upgrade and additional service in order to give incentives for players to stay however these actions will increase the cost and decrease the profit margin.

Four important things when occur then they lead that threat of substitutes will be **high**:

Quality of work for the substitutes is higher or equal than our product.

The way of work for the substitutes is higher or equal than our product.

The substitutes item is cheaper than our product.

The fee that customers will pay to change or switch the product is not remarkable.

In the same time, four important things occur then they lead to the threat of substitutes.

will be **low**:

The fee that customer will pay to change or switch the product is effect on player budget

The substitutes item has higher price than our product

The way of work for the substitutes is lower or equal than our product

Quality of work for the substitutes is lower or equal than our product

and finally, if there are no such product can be in the market instead of our product

Comments: something important and certain about our company, which is the focus on knowing new products in the market and their prices.this procedure is of great importance for our company, which seeks to give reasonable prices for products that has great value to the consumer as well as the ability to conduct questionnaire studies to know customer's opinion about prices and purchasing ability

4. Bargaining Power of Suppliers

This force analysis has a control on how much a company supplier has over a potential to raise its prices or to reduce the quality of purchase goods or services, which inturn will lower industries profitable potential.

Generally businesses are in a better position when there are a vast amount of suppliers. The fewer the suppliers are the more power they acquire. Important factors that determine supplier power are; the number of availability of substitute suppliers and the number of the concentration of suppliers to choose from in the industry.

Supportive companies in the field of gaming industries have a great and effective impact in the market's stereotyping and how it behaves, and this behavior is a fundamental and very important role for companies that intend to enter this market - these suppliers companies can control the company level,putting pressure by raising the prices of the materials it supplies as well as preserving the quality and quantity of the product that the company supplies with.

Comments: it is necessary to maintain a serious and stable relationship with suppliers

5. Bargaining Power of Buyers

The internet has enabled the customers to be more informed which allows them to be more

empowered instantly. Companies can lower the buying power of the customers by implementing a loyalty program or by differentiating their product or services.

This field has a strong impact on companies seeking to enter the labor market - the customer has the great ability today to use social networking sites to know prices and thus can determine what can be bought and at reasonable prices for him/her. The Internet revolution has become a useful factor for the user, but for companies it has become an important thing that must be focused on.

Comments: Gaining customer satisfaction by knowing the types of games that the customer need and what these games contain from interactive features - as well as focusing on competitive prices that can meet the desire of any customer compared to the prices of products from other companies

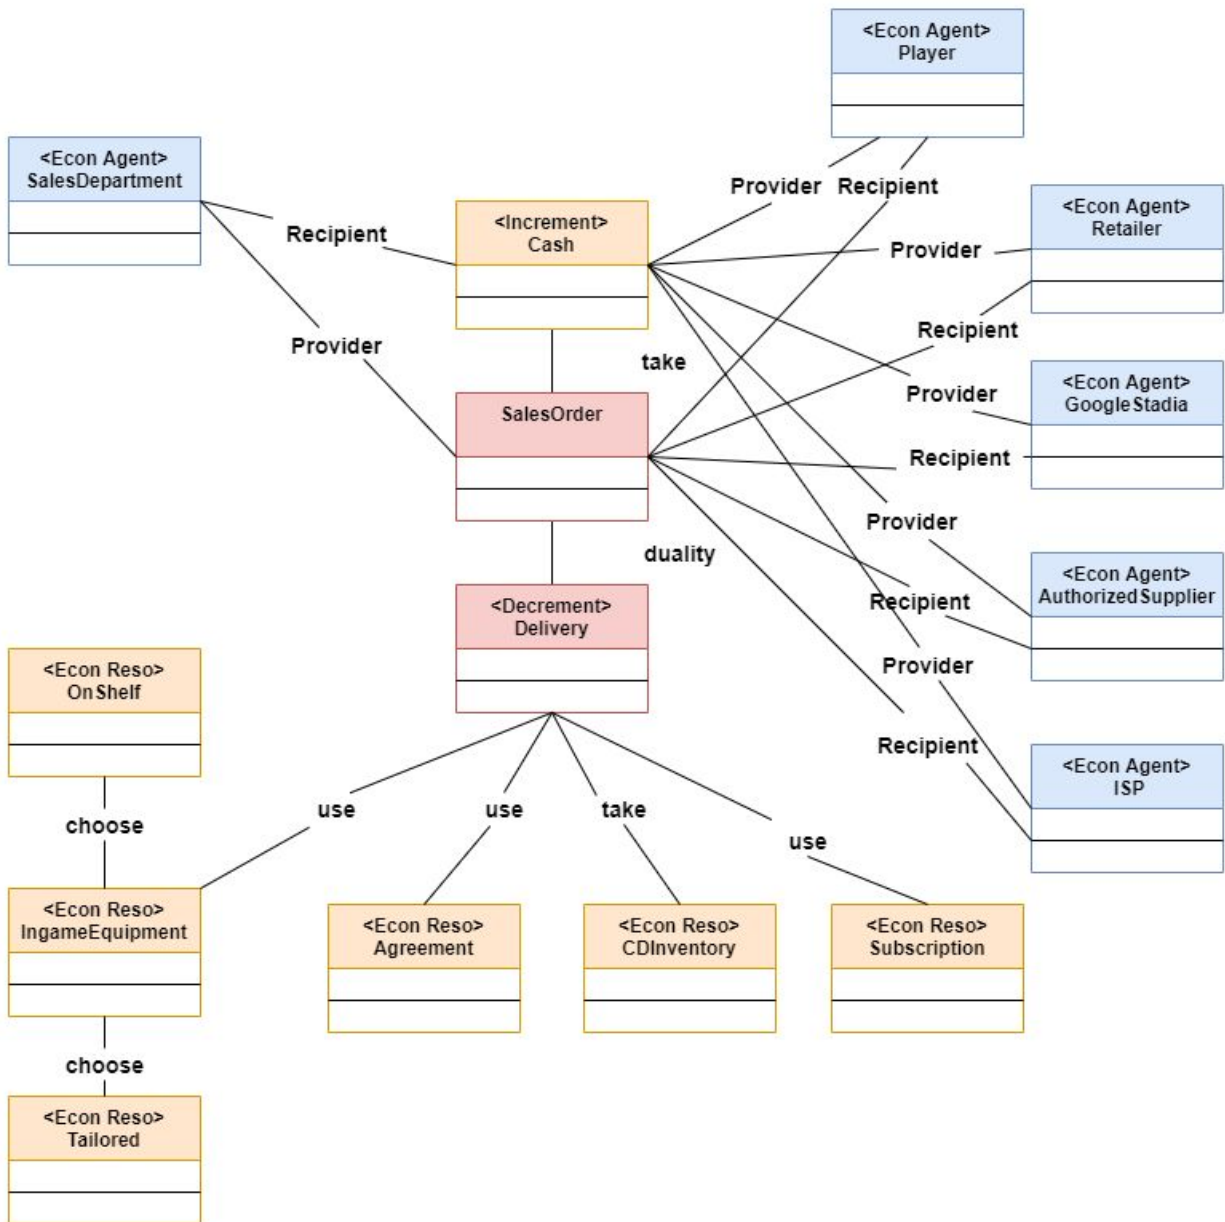

Conclusion: As we mentioned above Attempting to focus on these points has a fundamental and effective role in the success of the company and its continuation in the labor market - Competitive prices have a strong and large influence in this market, as well as the content required for the games is very important for gaining loyalty to the customer

4 Process Design

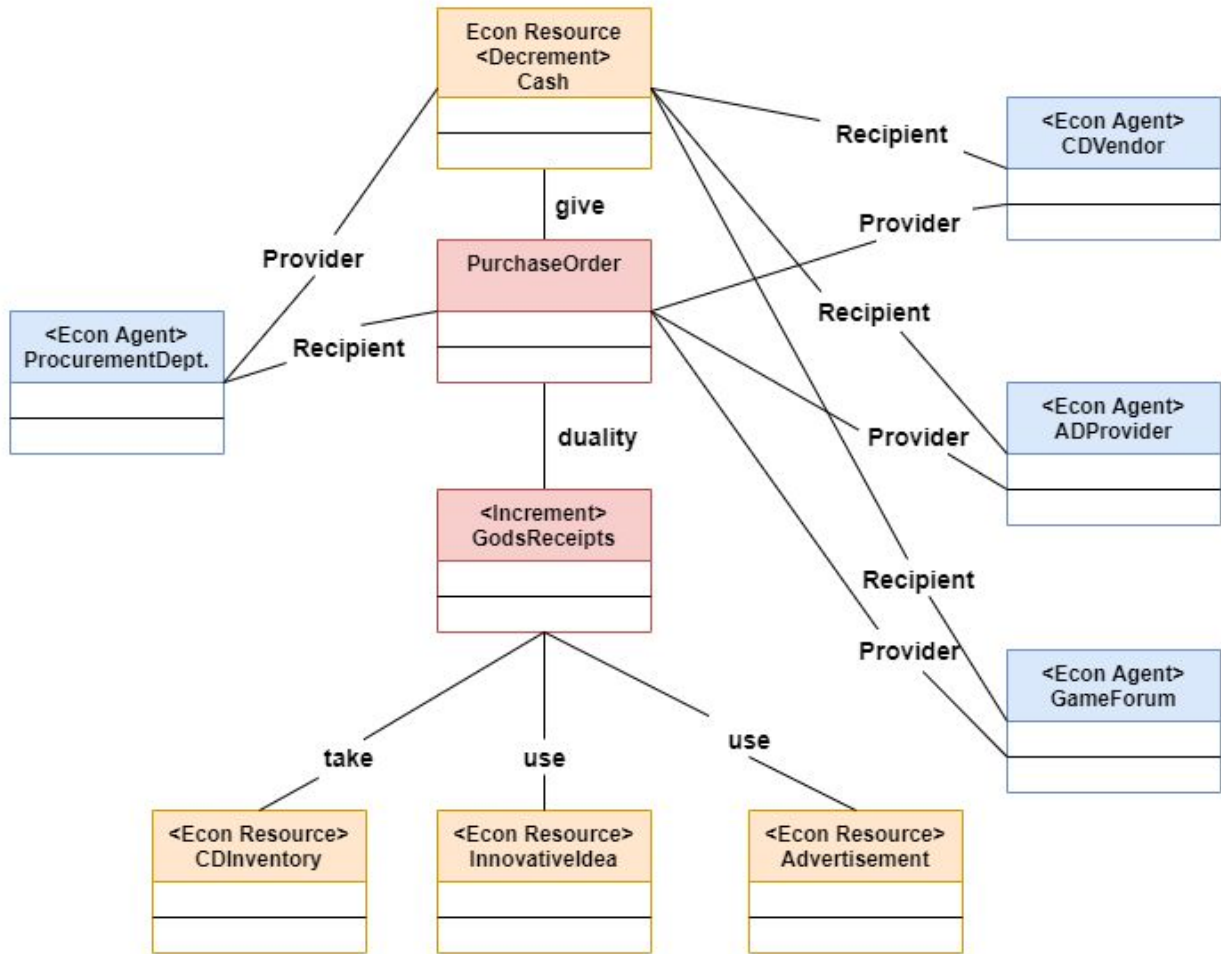

This section is to show the processes of the company in accordance with the VDML diagram.

4.1 Exchange and Conversion Processes in REA

Sales & Delivery Exchange Process

Purchase & Payment Exchange Process

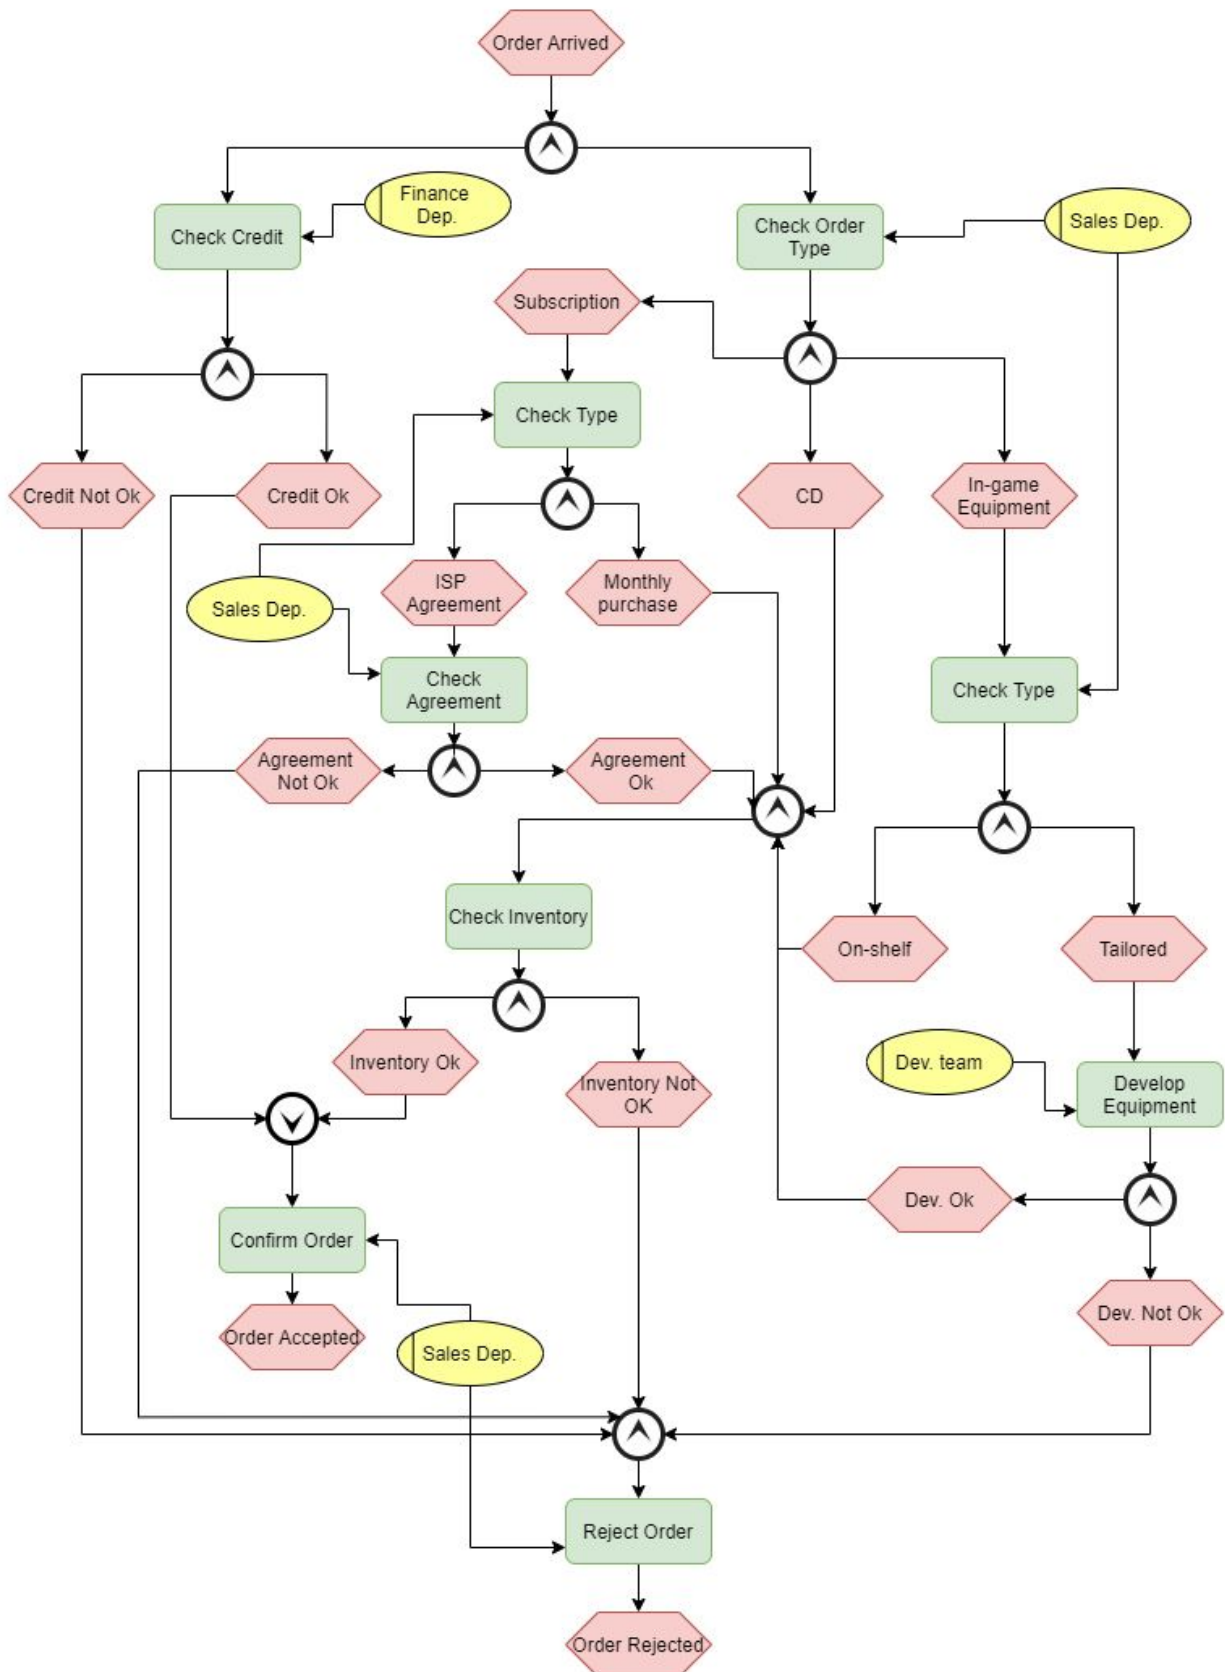

4.2 Detailed Processes in EPC

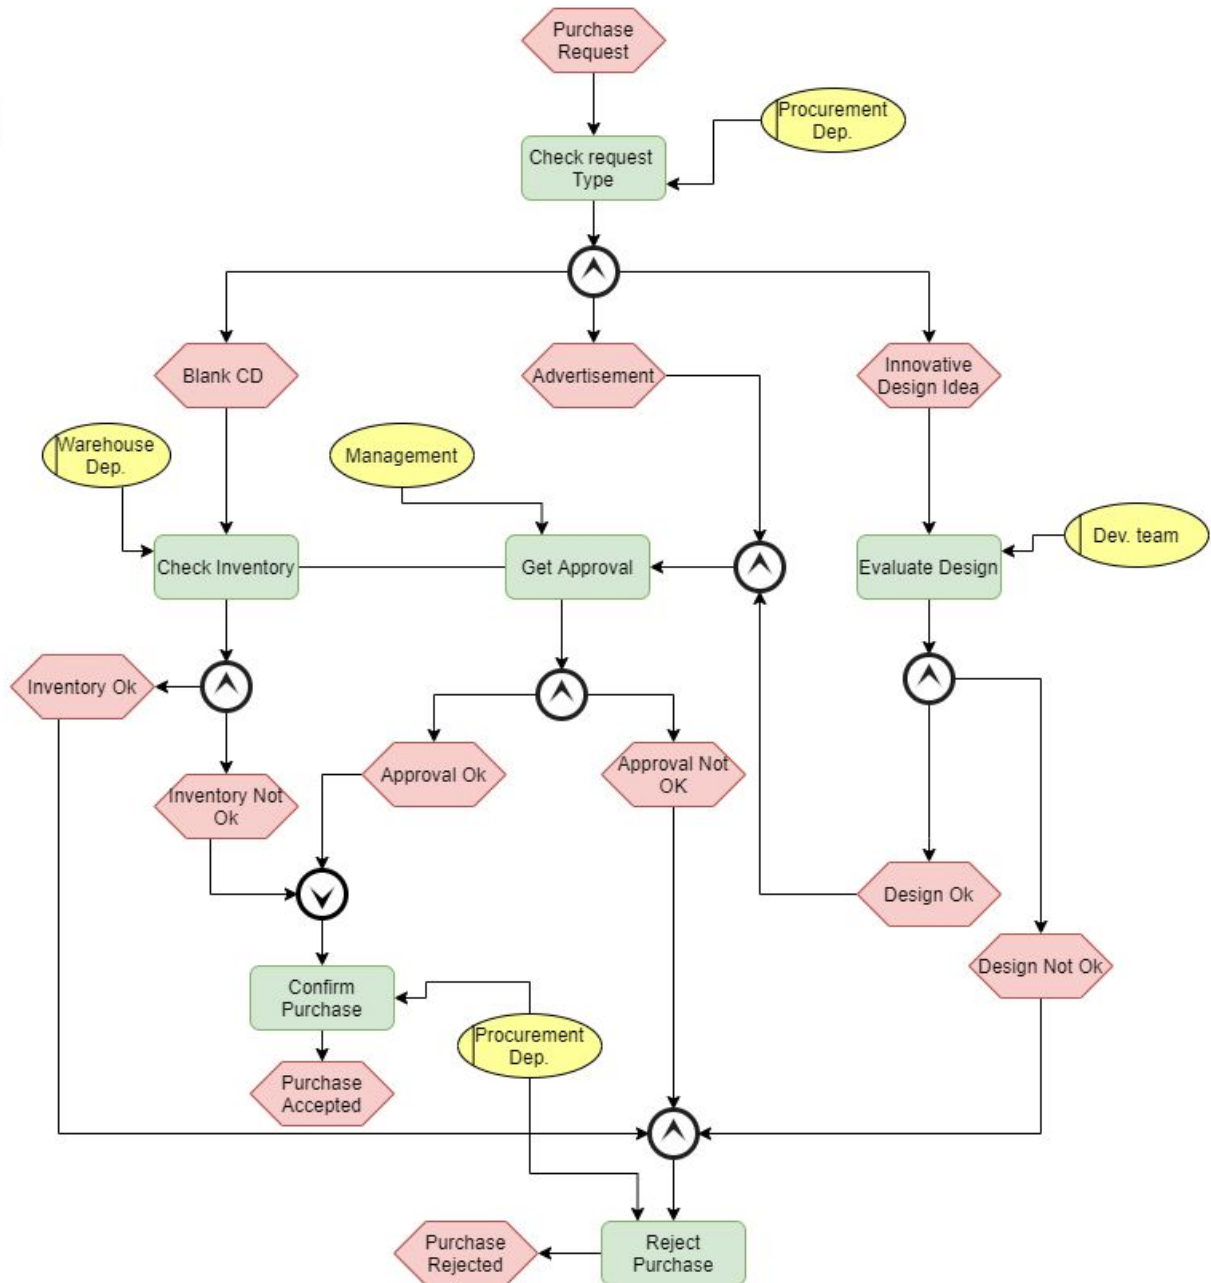

Include a number of detailed process models, expressed as EPC diagrams. The processes should include sales and procurement. The process models should show the actions of individual actors and handle alternatives and exceptions. It is

recommended to make each process diagram small by using the decomposition mechanisms of EPC diagrams.

Sales Order EPC for SABBA

Procurement EPC

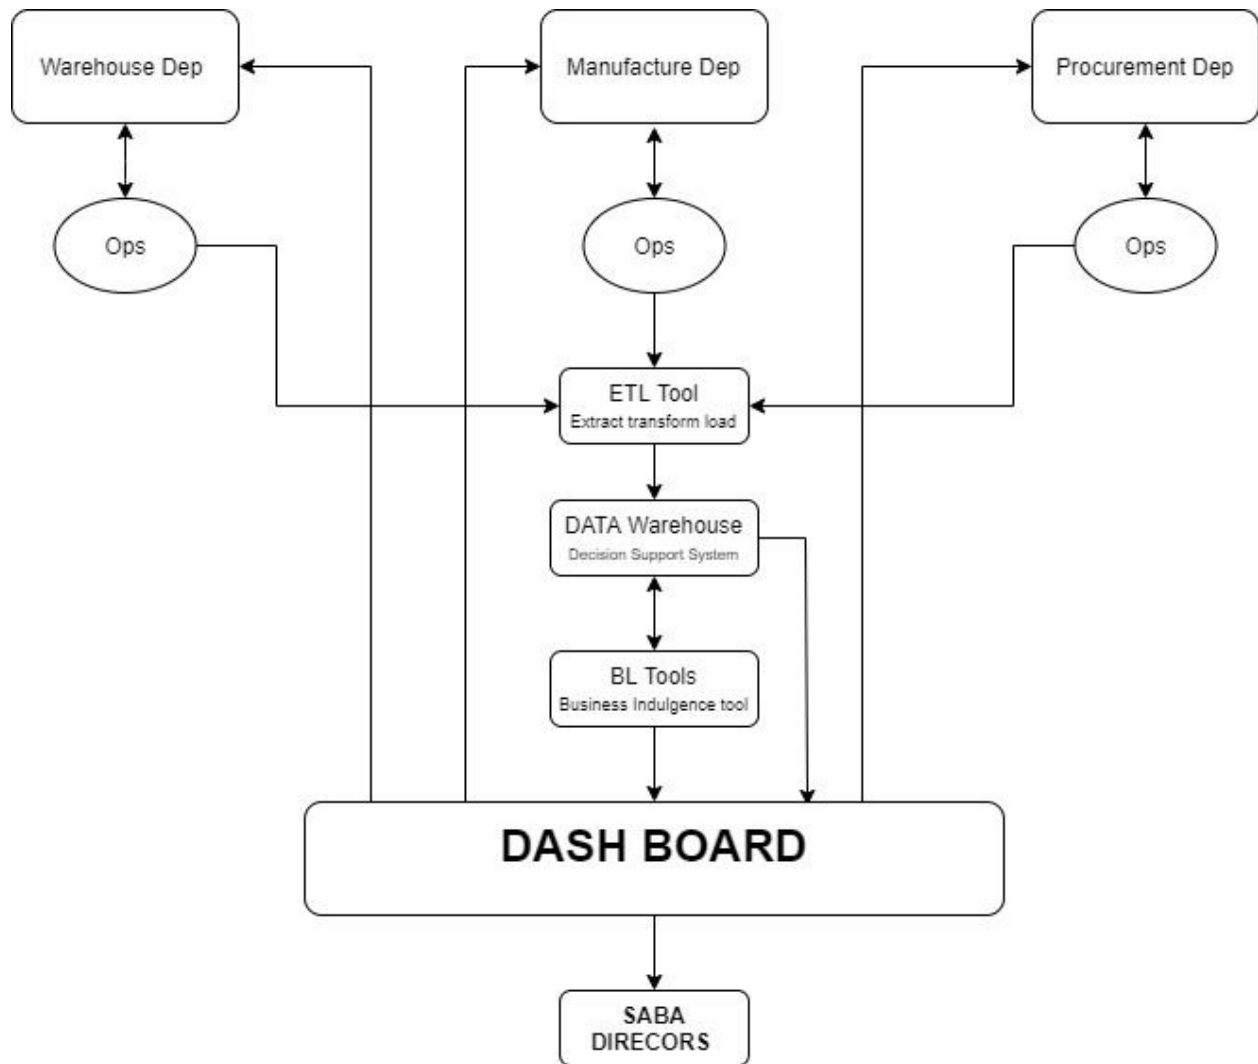

4.3 Relationships between Models

Include one or several tables that visualize the relationships between the models introduced in this section and the models in the previous sections. The tables should help to answer the following questions:

- How does the design of the processes help in fulfilling the goals of the company?
- What are the relationships between the exchange and conversion processes and the EPC models?
- What are the relationships between the EPC models and the VDML diagram?

5 IT Architecture Design

This section is to show the IT architecture of the company. The IT systems to be used in the company are to be specified, including BPMS, CRM, ERP, DW, BI tools, dashboard, and KM. The use of EAI and decision support systems (BI, DW, and Dashboards) shall also be discussed. The IT architecture shall be documented graphically in a diagram showing the systems and the data flows between them, representing systems as nodes and data flows as labeled arrows. The relationships between the systems and the business processes they support shall be made explicit.

6 Business Performance Management

This section is to introduce the key performance indicators (KPI) for measuring and analyzing the business processes of the company.

6.1 Leading and Lagging KPIs

Include between five and ten leading and lagging indicators. Each indicator shall be described in an indicator template consisting of at least the following parts: name of the indicator, the definition of the indicator, which goal(s) in the company's goal model that the indicator is related to, target values, which part of a business process (i.e. which activity) the indicator measures, which IT system that will be the data source for the indicator, and which type of IT solution will feed the dashboard system with data from the source system. Ensure that the descriptions are consistent with the IT architecture in Section 5.

lagging indicators

A

- 1-Games Language
- 2- Lagging Indicator
- 3- Is related to Goal 2,3
- 4- The target value is combining new languages to be more easier for customer to play the game
- 5- The indicator measures the activity between SABA INC and Google Stadia, Game Retailer, Game Supplier (give, take)
- 6- IT system that give us the current value of Games Language is Manufacture Dep
- 7- IT solution will feed the dashboard system is from ELT tool AND Data WereHouse

B

- 1- Game subscription via ISPs
- 2- Lagging Indicator
- 3- Is related to Goal 2,4
- 4-The target value is to improve the agreement between SABA INC and ISPs in different ways to have more customers.
- 5- The indicator measures the activity between SABA INC and ISPs(give, take)
- 6- IT system that give us the current value of Game subscription via ISPs is Procurement Dep
- 7- IT solution will feed the dashboard system is from ELT tool AND Data WereHouse

C

- 1- Product Advertising
- 2- Lagging Indicator with no Adv usage

3- Is related to Goal 1,2,4

4- The target value is using social media combined with suppliers, retailers, google Stadia and ISPs to push an Encourage advertisement for customers.

5- The indicator measures the activity between SABA INC and Game Forum(give, take)

6- IT system that give us the current value of Game subscription via ISPs is Procurement Dep

7- IT solution will feed the dashboard system is from ELT tool AND Data WereHouse

leading indicators

A

1- More game Equipment

2- Leading Indicator

3- Is related to Goal 2,3

4- The target value is to improve the amount and performance of game equipment among customers.

5- The indicator measures the activity between SABA INC itself as a game equipment distributor and game supplier and customer(give, take)

6- IT system that give us the current value of Games Language is Manufacture Dep

7- IT solution will feed the dashboard system is from ELT tool AND Data WereHouse

B

1- Play more Earn more

2- Leading indicator

3- Is related to goal 1,2

4- The target value is to let the customers play more to get more coins (??? Coins you get ??? from company)

5- The indicator measures the activity between SABA INC and customers(give ,take)

6- IT system that give us the current value of Game subscription via ISPs is Procurement Dep

7- IT solution will feed the dashboard system is from ELT tool AND Data WereHouse

6.2 Evaluation of KPIs

Include an evaluation of the KPIs from the previous subsection, based on the article by Eckerson.

7 Enterprise Architecture Evaluation

In other parts of the work, you have designed the organization from several perspectives, goals, processes, IT architecture, and so on. All of these combined converge towards an Enterprise Architecture (EA). A key component of EA is capability, ability, and capacity that enable an enterprise to achieve a business goal in a certain context. In this light, your task is to design one capability based on the models already created. The first step is to fill in the capability elicitation template in terms of relevant goals, KPIs, context, business process variants. This should be followed by a graphical design of a capability model, for instance, by introducing links between the newly developed capability and the corresponding constructs in other models.
